Not possible with only using JS, HTML and CSS:

- Using a real database instead of just browser storage
    - Checking and handling form data on the server
    - Letting users log in and manage accounts (optional)
    - Syncing data in real time for everyone (available animals)
    - Keeping sensitive info safe and secure (personal details of partners)

These things need a backend, not just HTML, CSS, or browser JavaScript.
